

write a c++ code which includes a class student and find the space occupied by the object of the class

```
#include <iostream>
using namespace std;
```

```
class student
{
private:
    int rollno;
    char name[30];
    float marks;
};
```

```
int main()
{
    student s1;
    cout << "size occupied
    by the object of
    student class = " <<
    sizeof(s1) << "bytes" << endl;
    return 0;
}
```

O/P

size occupied by the obj of student class = 40 bytes

NOTE

the output may be 36 bytes, 40 bytes or another value depending on the compiler and system because of memory alignment (padding)

Extra unused memory added by the compiler b/w data members or at the end of a class so that CPU can access data faster

~~without padding:~~

~~grade = 1 byte~~

~~rollno = 4 bytes~~

~~total = 5 bytes~~

rollno = 4 bytes

name = 30 bytes

marks = 4 bytes

padding = 26 bytes
